Vice Rector I for Academic Affairs of University of Brawijaya Malang, invited my institution to a meeting discussion held at UB Campus, on March 21st, 2012. Our institution was impressed by Joint Research Proposal developed together by University of Brawijaya (UB) Malang, School of Life Science and Technology – ITB Bandung, and Wageningen University & Research (WUR) The Netherlands. The research plan was developed from practical problems faced by shrimp farmers which then formulated into scientific research questions. Every solution came out from these researches will have practical implications in solving the problems of shrimp farming in East Java in particular and Indonesia in general.

Herewith, my institution is committed to provide support for the research, in, but not limited, to the followings: (1) provide access for the researchers to use our field facilities (brackish water farm) which can be used for field testing; (2) organize / facilitate a link with regional shrimp farmers in East Java for the availability of field data; (3) identify a budget center within our institution that can be used to disseminate the results of shrimp biofloc technology to regional shrimp farmers and players. We this Joint Research Plan will contribute significantly toward solutions of shrimp farming in East Java which is also the main concern of our institution.
